

ABSTRACT OF THE DISCLOSURE

An edge sharpener for various implements is provided. The edge sharpener includes a sharpener body having a pair of sharpening elements secured to a sharpener body in a fixed angular relationship. The sharpening elements are moveable along this fixed angular relationship to provide a fresh sharpening edge without removal of the elements from the body. The edge sharpener may be provided with precision adjusters for indexing the sharpening element. Further, a removable handle may be provided. By use of sharpening elements of a shape other than rectangular, more than one fixed angular relationship can be provided. Durability of the sharpening edges is enhanced by the form of the edge relief.
